**Daily operational forecast for December 23, 2019**

The operational forecast of possible emergencies on December 23, 2019 on the territory of the Russian Federation is caused by the passage of 4 cyclones, 3 anticyclones and the action of atmospheric fronts.

On the territory of the Russian Federation, emergencies caused by dangerous and adverse meteorological phenomena are not predicted.

In connection with the process of ice formation, there is a risk of failures of people and equipment under the fragile ice of water bodies throughout the Russian Federation except for the Southern Federal district and the Northern Federal district.

In the mountains of the Altai Republic, Khakassia, Tyva, Krasnodar territory and the Republic of Adygea avalanche.

There is a possibility of activation of landslide and talus processes, landslides, subsidence of soil in mountain and foothill areas of the North Caucasian and Southern Federal district (high level of soil moisture).

In the Far Eastern Federal district: the activity of the volcano Bezmyany gradually increases. At any time, an eruption with ash removal up to 10-15 km is possible. Ash plumes can pose a danger to flights on international and local airlines.

The information was prepared based on the data of the Hydrometeorological Center of Russia and the Research Institute of All-Russian Research Institute of Civil Defence and Emergencies (FC).
